SUMMARY

Four years in software testing across three companies. At R7 I joined as the first QA engineer on the product and, over eighteen months, built test automation from nothing into a production platform: roughly 400 automated tests in Playwright and pytest across nine product modules, environment provisioning cut from three days to thirty minutes, and large language models embedded in the pipeline with formal validation of their output. I lead the automation team: hiring, mentoring, and training the department.

EXPERIENCE

QA Automation Lead, Corporate Server

02/2025 - present

R7

Enterprise collaboration platform: mail, drive, calendar, projects, administration. First QA engineer on the product; automation, infrastructure and process were built from scratch. Team: one automation engineer, one intern, and two manual testers part-time.

- Cut release environment provisioning from **three days to 30 minutes**: Ansible playbooks and Jenkins installation pipelines across **11 servers and 5 Linux families** (RedOS, Astra, Alt, Debian, Ubuntu) in online, offline and Docker configurations. Testing now starts the day a build ships.
- Built the UI automation framework in Python, Playwright and pytest: **about 400 tests across 9 product modules**; the full TestIT case library was converted to code, with cases living in git and going through code review.
- Launched API automation: a contract layer generated from OpenAPI with schemathesis, covering **474 endpoints across 80 domains**, plus functional scenarios for the critical domains and a separate security testing track.
- Embedded LLMs into the testing process with quality control over the output:
 - a TestIT integration CLI: case export via API, test generation from a test case with AST-based code validation and verification of calls against the real Page Object, plus coverage reporting. Writing a test dropped from **15-30 minutes of manual work to minutes**;
 - automated triage of every CI failure: root cause and recommendation derived from JUnit XML and logs, **seconds instead of hours**;
 - AI analysis of installation logs with secret masking before the request leaves the pipeline.
- Moved Jenkins to **Infrastructure as Code** with Job DSL: 23 jobs with parameters, schedules and agent bindings are provisioned from a single file; an orchestrator runs the suite across **10 environments** from a declarative catalogue and posts a summary to Telegram.
- Built CI on GitHub Actions: fail-fast smoke, then regression, then AI failure triage and artefacts. Feedback on a commit in about 10 minutes.
- Made releases transparent for the customer: an HTML test plan report and Telegram digests are used during release acceptance.
- Proved the platform generalises: the mail server test suite runs on the same infrastructure with no rewrite.
- Team and process: hiring, an intern grown through an individual development plan, and department-wide training.

QA Automation Engineer

03/2024 - 02/2025

Avroid, startup

- Established testing from scratch: process, test documentation, and automation in Python.
- Built the team's infrastructure: GitLab, and a hardware rig on ESP32 for input testing.
- Delivered a Telegram support bot integrated with the CRM and issue tracker, from problem statement to rollout; still in use today.
- Built a RAG system over the Aurora OS documentation together with an agent for the support team: answers grounded in the documentation, with automatic reproduction of the scenario on a mobile Linux emulator.

Python · Docker · GitLab · Jenkins

QA Engineer, release acceptance

08/2022 - 03/2024

MyOffice

- Release acceptance testing of B2B products across all platforms: the go/no-go decision on a build, working with development, DevOps, information security and customers.
- Introduced API testing to the department (Postman, Newman in CLI, documentation); it became the department standard.
- Covered the vacant DevOps role for six months: Docker Compose, Python mock servers, Jenkins builds; handed over a working system to the incoming engineer.
- UI and API automation: Selenium, Appium, requests.

Python · Selenium · Appium · Postman · Newman · Docker · Jenkins

SKILLS

Languages: Python (primary), Java, Kotlin, Bash, Groovy, SQL

Automation: Playwright, pytest, Selenium, Appium, requests, schemathesis, Postman and Newman

Testing: UI, API (REST, OpenAPI contracts), event-driven integrations (Kafka), integration, regression, security testing

CI/CD and infrastructure: Jenkins (Job DSL), GitLab CI, GitHub Actions, Infrastructure as Code (IaC), Ansible, Docker, Kubernetes, AWS, Git

AI in testing: test generation with large language models (LLM) under AST validation, automated failure and log triage

Platforms: web, Linux (RedOS, Astra, Alt, Debian, Ubuntu), macOS

Leadership: automation team, hiring, mentoring, department training

Languages: Russian - native; English - Upper-Intermediate (B2)

EDUCATION

BSc, Business Informatics

Plekhanov Russian University of Economics

Auditing student

HSE University, Faculty of Computer Science

Calculus, discrete mathematics, algorithms and data structures, computer architecture and operating systems; machine learning and recommender systems in progress.

SIDE PROJECTS

P.R.O. - an AI-powered sports app, published on the App Store: backend and AI features (recommendations, goals, progress forecasting, assistant).

PRO Local AI Lab - on-device inference of language and multimodal models on iPhone: MLX, llama.cpp, Core ML, Whisper, Hugging Face.
